Abstract

There is a lack of basic anatomic informations regarding the ossa cuneiformia. The aim of the present descriptive study was the detailed evaluation of the anatomy of the ossa cuneiformia. We analyzed 100 computer tomography scans of feet without deformities or previous trauma. The length, height and width of each cuneiforme and their articular surfaces were assessed. We itemized the data to gender differences and to foot length. The medial cuneiforme os had a length of 23.8 ± 2.4 mm (mean \pm standard deviation), a width of 15.9 ± 2.7 mm and a height of 26.9 ± 3.6 mm. The respective values for the intermediate cuneiforme were 17.7 ± 1.9 mm, 12.4 ± 3.1 mm and 20.8 ± 2.9 mm and for the lateral cuneiforme 24.3 ± 2.9 mm, 14.9 ± 2.9 mm and 17.3 ± 4.3 mm. We found statistical relevant differences regarding gender and foot length subgroups whereas not for all parameters. The present study illustrates basic anatomic data
